User Stories ⋯

As someone looking to buy a car, I want to be able to check the types of cars I'm interested in to see if they have had any issues or recalls

As a car owner, I would like to be able to check if my car has had any issues or recalls via a secure database or user interface and to be able to interact with my car's status as well as the website.

As someone who is looking to purchase another vehicle, i would like to be able to value my car based on the number of Kilometres driven and the number of accidents the car has been involved in, so that i may determine a rough estimated value of my car to trade in

User Stories and Points

The following are user stories with points identified from key words as story points that the user mentioned and would like to see developed:

User story 1: As someone looking to buy a car, I want to be able to check the types of cars I'm interested in to see if they have had any issues or recalls.

User story 2: As a car owner, I would like to be able to check if my car has had any issues or recalls via a secure database or user interface and to be able to interact with my car's status as well as the website.

User story 3: As someone who is looking to purchase another vehicle, I would like to be able to value my car based on the number of Kilometres driven and the number of accidents the car has been involved in, so that I may determine a rough estimated value of my car to trade in.

The definition of a story point in this situation is a need from a user that can then be actualised into a feature.

The first user story has the following story point:

- The need to check for the type of car in addition to its status.

The first and second user stories have the following story points in common:

- Status of the car to check for any issues or recalls.
